

Turning AI work into an organizational capability.

THE STAKES

Your best people already use AI well. It's stuck on their laptops.

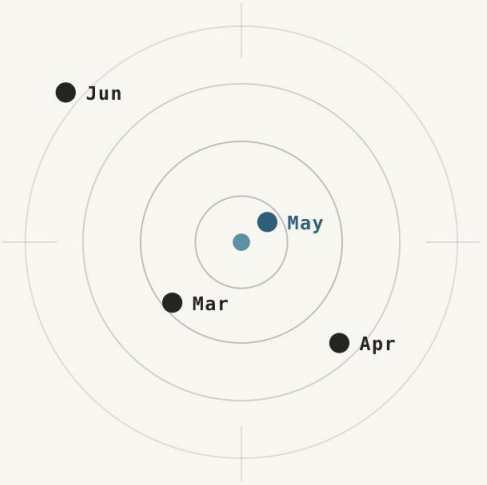

A clever personal workflow never
becomes a tool the whole firm can use.

THE PROBLEM

Everyone is using AI.
Nobody is getting better at it.

Inconsistent prompting leads to inconsistent results.

MARCH	“what's the latest on Halston Industrial?”
APRIL	“give me a status update on Halston”
MAY	“Pull together Halston Industrial before the quarterly review: covenant headroom, order book vs. plan, and flag anything that puts the credit at risk.”
JUNE	“halston update pls”

ONE ANALYST · ONE PORTFOLIO COMPANY · FOUR MONTHS

WHY THIS IS NEW

For the first time, being bad at software costs more than being good at it.

The less you put in, the more it has to spend working out what you meant.

JUNE “halston update pls”

---

01 **More research.** It has to work out what you meant before it can start.

02 **Longer sessions.** More turns spent whittling a vague answer down to the one you needed, every turn at full price.

03 **A bigger model.** Only a smart model can get a good answer from a vague question. You're paying it to do the thinking.

A worse answer, at several times the cost.

THE PART NOBODY COUNTS

And it's making your outcomes generic.

The model makes the judgment calls you didn't, and it makes them the same way for everyone.

WHAT ACTUALLY SHAPED A SESSION

- **Your judgment.** Your context, your taste, the decisions you already made.
- **Best guess.** The model filling in what you probably meant.

You are paying a premium to think like everyone else.

WHAT GOOD LOOKS LIKE

This is a configuration problem.

The more the work leans on what's yours, the more it comes out like you.

WHAT YOU WANT IT TO LOOK LIKE

- **Your judgment.** The context, skills and memory the product already holds for you.
- **Best guess.** Only the part nobody could have written down in advance.

Your best people already do this by hand, one prompt at a time.

OUR BET

And it should be a by-product of usage.

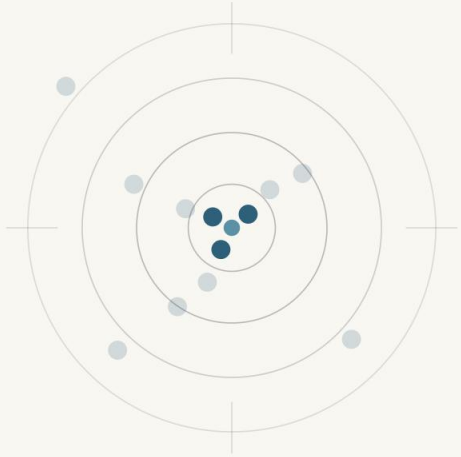

You do the job. Bonsai keeps track of how you did it.

01 **No skill.**
Every run starts from a blank prompt.

02 **Bonsai creates a skill.**
Written from what the user actually did.

03 **Bonsai improves it.**
Corrections and preferences fold back in overnight.

04 **Bonsai improves it again.**
Every run sharpens it further.

WHAT YOU TYPED

“halston pls”

The prompts don't get better. The results do.

THE PRODUCT

Bonsai is where the work happens.

Connect the systems you already use, then just do your job. Any model: Anthropic, OpenAI, Gemini, DeepSeek or open-weight, on your own keys.

WHAT YOU ASKED, ONCE

"Pull together Halston Industrial before the quarterly review and flag anything that puts the credit at risk."

One analyst, one afternoon, in plain English.

WHAT BONSAI KEPT

SKILL	**Portfolio review brief** The steps this job takes, in order, ready to run again on the next company.
MEMORY	**The Halston position** What you hold, who signs off, what they pushed back on last quarter.
DELIVERABLE	**Halston review brief** The finished document, every number traceable to the system it came from.

You did the work once. Everything under it is reusable.

It closes the loop after every session.

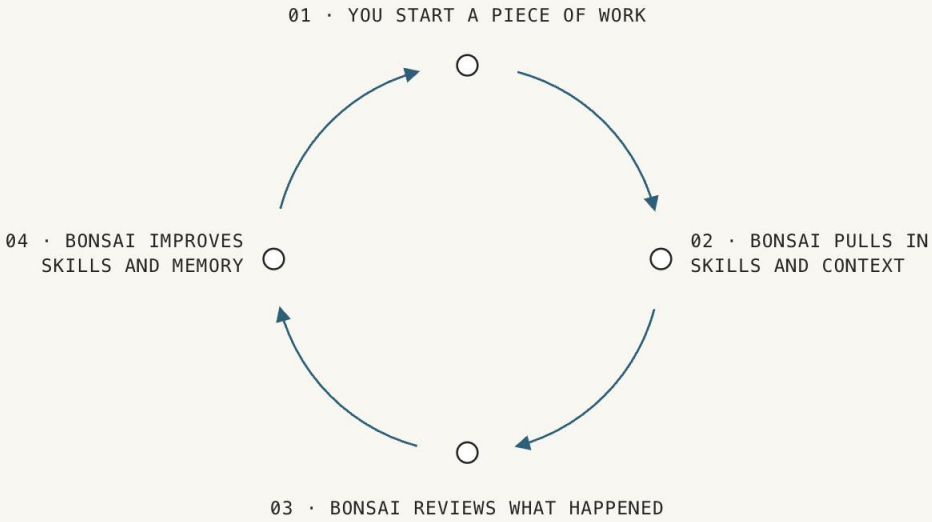

When you finish a piece of work, Bonsai reviews what just happened and updates what it knows.

RUNNING IN THE PRODUCT TODAY

Remembers the facts, names and decisions worth keeping

Corrects the instructions this session just proved wrong

Takes stock of what was done, so none of it is lost

Every run feeds the next one

PRIVACY AND SECURITY

And your work never touches our servers.

Bonsai runs on your machine. Your sessions, your memory, and your skills stay there.

WHAT THIS MEANS IN PRACTICE

Sessions, memory, and skills	are files on your disk, not rows in our database
We never see your work	diagnostics are off by default, anonymous when enabled, and never carry content
Your model agreement, not ours	bring your own keys and your existing terms apply unchanged
Air-gapped if you want it	a fully black-box setup, with zero signal back to us, is supported

The safest place to run AI on your work is the machine it is already on.

THE PAYOFF

So what does this get you?

Better results from cheaper models. Visibility into every cent. Compounding across your team.

PAYOFF · COST

Codified work makes cheaper models more effective.

When a task has a fixed shape, you know which parts need frontier reasoning, and which never did.

01

Pull the financials

`small + fast`

02

Extract the covenant figures

`open-weight`

03

Summarize the lender correspondence

`open-weight`

04

Decide what matters, write the brief

`frontier`

One of these four needs the expensive model. Ad-hoc prompting pays frontier prices for all four.

PAYOFF · VISIBILITY

Your organization's AI effectiveness, down to the token.

We measure four things, always against how you were working before.

COST

Are you spending less than you would have?

You name the model you would have used anyway. Bonsai reports what the work actually cost against that baseline.

FORMALIZATION

How much of your work has a fixed shape?

Share of sessions running through a skill, and the miss rate where one should have run and did not.

COMPOUNDING

Is the second run cheaper than the first?

Repeat work measured against its own earlier runs, in the task buckets your teams actually use.

UPKEEP

What does the self-improvement loop cost?

The review lanes run at a small, capped share of spend, reported next to what they produced.

PAYOFF · FLEXIBILITY

The harness is the product.

The models are converging, and the price of intelligence keeps falling.

MODELS	**Every model is getting good and cheap** With the price of intelligence falling, no single model stays an advantage for long.
THE HARNESS	**What your firm builds on top is what lasts** Skills, memory and context carry over when you change models, so you move to the best infrastructure underneath without rebuilding.
THE WINNERS	**Firms whose harness lets them build faster and better** Better work on the best infrastructure available, with no vendor lock-in.

When every model is good and cheap, flexibility is the advantage.

WHERE THIS GOES

The longer you run on Bonsai, the less you lose when people leave.

Every person's work builds a living knowledge graph. Each graph is theirs. What the firm shares is process, not taste.

TODAY

Better AI

The graph makes each person's own work sharper, because the system already knows their context.

SOON

Continuity

A vacation, a parental leave, a transition. The work continues because the context no longer lives in one head.

ALWAYS

Less key-person risk

When someone leaves, their knowledge graph stays with the firm.

PAYOFF · SCALE

Your best employees pull everyone else up.

Proven work spreads instead of being rediscovered, and every user personalizes on top of it.

PERSONAL

portfolio-review v3

One person's skill, sharpened over a dozen real runs.

↓ REVIEWED AND VERSIONED

TEAM

Published to the deal team

Everyone starts at v3 instead of a blank prompt, and personalizes on top of it.

↓ APPROVED FOR WIDER USE

ORGANIZATION

Standardized across the firm

Improvements made anywhere flow back through the same review.

Using AI isn't the advantage.
Getting better at it is.

The AI economy runs on 30 million developers. 1.5 billion knowledge workers are next.

Most token revenue comes from coding.
Everywhere else, diffusion is still thin.

30M	**Developers** The vast majority of token spend today. Diffusion is deepest where the users write code.
1.5B	**Knowledge workers** Everyone else. Almost none of their work runs through AI yet.
DIFFUSION	**Code is deepest. Law took off in the last 12 months.** Broad knowledge work is less than 5% diffused. Counts are industry estimates, and diffusion depth is directional, not measured.

The opportunity is the other 95%.

APPENDIX · THE NEXT STEP

Thirty days, measured against your own baseline.

A small engagement on one real workflow your team already relies on.

THE COHORT	**Five to ten users on comparable work** Starting from that one workflow.
THE MEASUREMENT	**Cost and quality, before and after** On your own numbers, with model mix and the useful skills created alongside.
THE FRICTION	**None for your security team** Runs on your machines, your keys, your model agreements. Air-gapped if you want it.
THE SHAPE	**A small number of design partners** We build your first workflows with you.
